

Seattle Manlift Certification

Seattle Manlift Certification - The Elevated Platforms and Manlifts Certification course helps to provide the needed training on the safe operating procedures, work practice, regulations and rules regarding the daily activities for the operators of this machine. The course has been designed for individuals who are actively involved in these activities or individuals who have a basic knowledge of this equipment.

In the past couple of decades, manlifts and aerial platforms have become a common sight on construction job sites and in industrial maintenance applications. These machines provide an easy way to lift workers close to what needs to be done on a stable platform apparatus, allowing staff to carry out tasks with greater comfort and safety rather than being perched on top of ladders or scaffoldings.

Similar to every other device, manlifts are just safe when they are utilized properly. As they elevate workers above ground level or floor, accidents can easily happen and this may result in serious injuries or fatalities for both the manlift operators and whoever passerby who may be unlucky enough to be standing beneath.

There are a variety of kinds of manlifts. Nearly all fall into 1 of 2 categories: the articulating boom lift, that has the capability of both vertical and horizontal movement and the scissors lift, which is capable of moving upward and downward.

Protecting Staff

Correct training is very important when it comes to safety matters. Many of the companies that rent manlifts would provide training at the jobsite. Each worker who will be working on the machinery or operating it has to receive training in safe operations. It is also vital that just those workers who have received training must be authorized to operate the controls. Operating procedures and communication rules should be clear. Hence, employees on the ground must not operate controls without the knowledge and approval of any employees in the basket.

The staff that occupy the basket would be required to wear the right fall protection gear that consists of a lanyard and harness. The fall protection attaches to the manlift easily. The worker should ensure that he or she has made whichever adjustments required to reflect the change in fall distance if the height of the work area changes.

Manlifts should be tested and inspected each and every day to make certain they are in safe operating condition. Prior to using the machinery, whatever defects should be re-inspected and fixed.
