

Seattle Scissor Lift Operator Certification

Seattle Scissor Lift Operator Certification - Regulations in North America normally recommend that operators of booms, scissor lifts or aerial work platforms all obtain operator certification. Scissor lift operator certification is not mandatory, but there are benefits to ensuring that this training is provided to all of the operators.

To be able to enable workers to have access to high levels, the scissor lift is a work platform made together with a pantograph, which is a connected, folding support that shaped in an 'X' pattern. Upward movement occurs when pressure is applied to the outside of the lowest set of supports, propelling the work platform vertically by elongating the 'X' pattern. A bridge extends from some platforms to allow convenient access to the work site.

The platform returns to the ground by manually releasing a valve. The platform returns through simply releasing the hydraulic or pneumatic pressure. This is the key reason that scissor lifts are the best equipment at worksites.

Both new and experienced operators could benefit from right scissor lift training. This program could be tailored to focus specifically on the particular machine models at your workplace. The trainees' certificate of training would list the kinds of machines on which they trained.

The classroom instruction includes the following topics: introduction to scissor lift training; attitude, rules and guidelines and authorization; safety rules and common hazards; Occupational Health and Safety; workbook and record of training (or otherwise referred to as ROT)

The end of the in-class section is finished with a written test.

Practical hands-on training comprises instruction about the following: safety equipment; pre-operational check; operator guidebook; regular maintenance; function test checklist; and the practical session will end with a proficiency demonstration.
