

## Seattle Forklift Instructor Training

Seattle Forklift Instructor Training - For those forklift operators who wish to become a forklift instructor it is suggested that they complete a forklift Instructor training certification course. Entry qualifications for the forklift instructor training requires the forklift operator to have extensive knowledge regarding forklift equipment and skills driving forklifts. Instructor training usually is held at an equipment sales facility or at the campus of a community college, junior college, or technical or vocational school. Forklift manufacturing companies occasionally provide practical, hands-on, train-the-trainer programs.

The trainee registers for the program, they would be required to pay the tuition fee, purchase manuals, books and other course materials, regardless of whether they are being instructed in a classroom setting or at the facilities of a particular manufacturing company. Course length varies depending on the course. Participants normally should have satisfactory demonstration, test scores and participation during the course to be able to qualify for trainer certification.

It is assumed that the trainee taking the instructor course would have previous experience using forklifts. The subjects of teaching techniques, ethics, safety issues and curriculum design would be the primary focus throughout the instructor training course. Those participating would know how to demonstrate to their students different aspects of forklift operation, like for example moving and stacking materials or navigating the forklift in narrow aisles. People participating would know how to assess student's written exams and demonstrations of their lift truck operating skills. The course goal is to prepare trainers to be able to design and implement their very own forklift training programs.

It is needed to do some self-study of the machines and guidebooks. The trainers will in the end be responsible for creating their own curriculum that satisfies specific guideline regulations in terms of the topics presented, such as Safety and Operation. Like for instance, the topic of Safety needs to include an understanding of how to identify possible hazards. The topic of Operation consists of instruction regarding attaching and utilizing, controls and instruments and maneuvering and steering the fork.
